Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Decarbonized Concrete competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Decarbonized Concrete production reached approximately 2650.108 k ton, with an average global market price of around US\$ 234.33 per ton. Decarbonized concrete is an innovative construction material, developed to mitigate CO₂ emissions during the production of traditional concrete by incorporating low-carbon raw materials, optimizing manufacturing processes, and integrating carbon capture technologies. Its current technological strategies primarily involve CO₂ mineralization and solidification, the replacement of clinker materials, and the creation of cement-free geopolymers or biological approaches. This material not only reduces the environmental load and advances the principles of a circular economy but also substantially decreases the carbon footprint of buildings over their entire lifecycle, while maintaining structural integrity and durability. It provides substantial backing for the construction industry's progress towards sustainable development, promoting resource conservation and environmental protection. Through these technological innovations, decarbonized concrete helps maintain ecological balance and enhances the overall performance of buildings, including thermal efficiency and durability, offering users long-term economic benefits and a comfortable living experience.

The global Decarbonized Concrete market size was estimated at USD 621.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.50% during the forecast period.
