## Abstracts

A declutchable worm gear is a type of mechanical gear that allows for disengagement (declutching) of the worm gear mechanism from the drive system. This feature enables the user to "disconnect" the driven shaft from the worm gear, making it easier to manually rotate or control the driven shaft without engaging the worm gear's mechanical drive. The declutching mechanism is especially useful in applications where manual override or free movement is required, such as in hoisting or lifting systems, conveyors, or in certain types of actuators.

The global Declutchable Worm Gear market size was estimated at USD 143.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
