Abstracts

Deep RF microneedling is a cosmetic and medical treatment technique that combines the principles of microneedling and radiofrequency energy. It uses a specialized device equipped with fine microneedles to create tiny channels in the skin. Simultaneously, radiofrequency energy is delivered through these microneedles deep into the dermis layer of the skin. The radiofrequency energy generates heat, which stimulates the body's natural healing process, promoting the production of collagen and elastin. This helps to improve skin texture, reduce the appearance of wrinkles, scars, and pores, and enhance overall skin firmness and elasticity. The depth of the microneedles and the intensity of the radiofrequency energy can be adjusted according to the specific needs and skin conditions of the patient.

The global Deep RF Microneedling market size was estimated at USD 272.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
