## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Deep-Sea Lithium Battery competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Deep-Sea Lithium Batteries are electrochemical energy storage devices specifically designed for high-pressure, low-temperature, and highly conductive underwater environments. They are widely used in ROVs, AUVs, underwater sensors, and deep-sea exploration equipment. Their design must meet requirements for pressure-resistant casings, sealing, battery management systems (BMS), and long-cycle stability. The product is priced at approximately \$8,000 per set, with global sales of approximately 140,000 units. The upstream of the deep-sea lithium battery industry chain consists of key components such as cell materials (e.g., lithium, cobalt, nickel, iron phosphate), high-strength casing materials (titanium alloy, PEEK), BMS control chips, cables, and sealing rings, ensuring energy density, safety, and reliability in extreme underwater environments. Downstream, they widely serve marine equipment manufacturers, energy companies, research institutions, and military units, providing power to platforms such as ROVs, AUVs, underwater sensors, and submarines. Future development trends will focus on lightweight design of high-pressure shells, AI-linked intelligent power management, application of underwater fast charging and wireless charging technologies, and the construction of a cell recycling and green manufacturing system, driving the deep-sea energy system towards high efficiency, intelligence and sustainability.

The global Deep-Sea Lithium Battery market size was estimated at USD 1122.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
