Report Overview:

The UV-C LED emits ultraviolet light with short wavelengths ranging between 200–280 nm and is also called deep UV. In recent decades, ultraviolet (UV) disinfection has become an appealing technology in the global water treatment industry due to declines in UV equipment costs and increased concerns about chemical disinfection. Although UV disinfection typically employs a conventional mercury vapor lamp, a relatively new technology is poised to make that lamp a thing of the past: the UV-C light-emitting diode (LED). The UV-C LED operates in the so-called C range of the UV spectrum, with a wavelength from 100 to 280 nanometers. In this range, the radiation can effectively be used to sterilization, perform forensic analysis, cure materials and disinfect water, among many other applications.

The Global Deep UV LED Market Size was estimated at USD 556.87 million in 2023 and is projected to reach USD 5971.91 million by 2029, exhibiting a CAGR of 48.50% during the forecast period.
