Report Overview

Defatted Wheat Germ Flakes are a nutritionally dense food product derived from wheat germ, which is the nutrient-rich part of the wheat kernel. The term "defatted" indicates that the wheat germ has undergone a process to remove a significant portion of its natural fat content, typically through mechanical pressing or solvent extraction. This process not only extends the shelf life of the product but also reduces its caloric content. The flakes are then created by drying and rolling the defatted wheat germ into a flake form, which can be easily incorporated into various food products such as cereals, baked goods, and nutritional supplements. These flakes are known for their high protein, fiber, and vitamin content, making them a valuable addition to a healthy diet. They are often marketed as a source of essential nutrients, including B vitamins, vitamin E, and various minerals, and are used to enhance the nutritional profile of foods or as a dietary supplement.
