Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Deflection Bypass Connector competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.Deflection bypass connector is a metal connection component used in steel structures, light steel keel walls and shear wall systems. It is specially designed to allow the connection parts to produce controlled sliding, deflection or expansion when displacement or deformation occurs between structural layers. The connector is usually made of galvanized steel, stainless steel or high-strength alloy, with guide slots, preset sliding holes or deformable arm structures. It is installed between vertical components (such as keels, joists) and transverse frames. When wind loads, earthquakes, thermal expansion and contraction or inter-layer displacement occur, the components are allowed to move in a limited manner to prevent structural hard connection failure or wall cracks. Deflection bypass connector is widely used in non-load-bearing wall systems such as multi-story office buildings, commercial buildings, airport terminals and hospitals where inter-layer deformation capacity must be considered. It is one of the key node components in modern lightweight buildings to ensure structural flexibility and ductility.

The global Deflection Bypass Connector market size was estimated at USD 56.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
