Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Degradable Bio-Based Plastic Bags competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Global sales of biodegradable bio-based plastic bags reached 109,000 tons in 2024, with an average selling price of \$8,399 per ton. Biodegradable bio-based plastic bags are plastic bags made from biomass resources (such as corn, potatoes, and sugarcane) through biological or chemical methods and exhibit biodegradability. Representative materials include polylactic acid (PLA), polyhydroxyalkanoates (PHA), and starch-based plastics. After use, these plastic bags can be decomposed into water and carbon dioxide by microorganisms in industrial composting or the natural environment, theoretically resulting in minimal environmental impact. In terms of cost structure, raw material costs for bio-based plastic bags account for as much as 60%–70%. For example, the production cost of PLA was once 2–3 times that of traditional polyethylene (PE). Although recent technological advances have reduced raw material costs by over 30%, the overall manufacturing cost remains significantly higher than that of traditional plastic bags. Furthermore, the production process presents high technical barriers, requiring the addition of degradation aids and control of thickness and mechanical properties, further driving up initial costs.

The global Degradable Bio-Based Plastic Bags market size was estimated at USD 919.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.60% during the forecast period.
