Abstracts

Degradable implants are innovative biomedical materials, mainly composed of natural or synthetic polymers, with good biocompatibility and biodegradability. After performing specific functions in the body for a period of time, these implants can degrade, disappear or be replaced by metabolites, without the need for secondary surgery to remove them. They not only relieve patients' pain, reduce the risk of secondary surgery and medical costs, but are also highly favored because their degradation products have no side effects on the human body. Degradable implants are widely used in orthopedics, cardiovascular and other fields, such as degradable magnesium alloy bone nails, zinc-based alloy vascular stents, etc., and have made important contributions to human health.

The global Degradable Implants market size was estimated at USD 4436.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
