Abstracts

Degradable microcarriers are specialized three-dimensional scaffolds, typically composed of biodegradable polymers such as polylactic acid (PLA), polyglycolic acid (PGA), or their copolymers (PLGA), designed to support the attachment, proliferation, and differentiation of cells in bioreactor-based cultures for applications in regenerative medicine, tissue engineering, and cellular agriculture. These carriers are engineered to degrade at controlled rates into non-toxic byproducts, allowing for the harvest of cell-based products without invasive detachment methods and minimizing downstream purification challenges. They are distinct from non-degradable alternatives by enabling a more seamless transition from expansion to therapeutic or industrial use, particularly in the production of cell therapies, cultured meat, and other advanced biomanufacturing processes where scaffold removal could compromise product integrity or safety.

The global Degradable Microcarriers market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
