Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Deionized Water Heating System for semiconductor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global XXXX production reached approximately 1,460 units, with an average global market price of around k US\$ 326 per unit. The deionized water heating system for semiconductor manufacturing is a precision-engineered equipment designed to heat ultrapure deionized water (DI water) to the exact temperature required by semiconductor processes while maintaining its exceptionally high purity standards to meet the demands of nanoscale chip production. In semiconductor fabrication, ultrapure water is critical for processes such as wafer cleaning, photolithography, and chemical mechanical planarization, where even trace impurities or temperature deviations can cause device defects or batch failures. Consequently, the system must maintain water quality at a resistivity greater than 18.2 M Ω cm, total organic carbon (TOC) below 1 ppb, and particle counts (
