Abstracts

A delay line interferometer is an optical device that utilizes the principle of interference to split, delay, and recombine light signals, often with precise phase control; it is a critical component in coherent optical communication systems, particularly for differential phase-shift keying (DPSK) and quadrature phase-shift keying (QPSK) modulation formats, enabling high-speed data transmission by converting phase-modulated signals into intensity-modulated signals for detection. This device plays an essential role in optical networks, test and measurement equipment, and quantum information processing due to its ability to provide stable, low-loss, and wavelength-selective interference with minimal environmental sensitivity.

The global Delay Line Interferometer market size was estimated at USD 25.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
