## Abstracts

Demand controlled ventilation (DCV) is a process designed to adjust/reprogram the ventilation settings within a building, based on the fluctuating occupancy. DCV systems can automatically reduce ventilation intensity during off-peak hours, saving a lot of energy in the process. They can also sense if the quality of indoor air is becoming polluted, and fix that by pumping fresh air faster into the building. Typically, DCV is one of the many features that most smart ventilation systems offer. Demand-controlled ventilation (VAV and DCV) is, as the term implies, ventilation solutions that manually or automatically regulate the airflow to meet the exact need at a given time, unlike CAV where the airflow is constant. If a room is empty, supply of air is reduced and if another room is full of people, the system will increase the volume to this area.

The global Demand Controlled Ventilation Dcv System market size was estimated at USD 480.94 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
