Report Overview

Demineralized whey powder is a specialized dairy byproduct derived from whey, the liquid remaining after milk has been curdled and strained during cheese production. It undergoes a demineralization process to remove a significant portion of minerals, particularly lactose and salts, resulting in a product with reduced ash content and enhanced nutritional suitability for specific applications. This powder is rich in high-quality proteins, including lactalbumin and lactoglobulin, as well as essential amino acids, making it a valuable ingredient in infant formula, sports nutrition, bakery products, and functional foods. The demineralization process adjusts the mineral balance to meet regulatory standards for sensitive applications, particularly in baby food, where excessive mineral content can strain immature kidneys. Due to its neutral flavor and high solubility, demineralized whey powder is also favored in processed foods, beverages, and dietary supplements where mineral interference must be minimized. Its production involves advanced filtration technologies like ion exchange or electrodialysis, ensuring consistent quality tailored to end-use requirements.
