### Report Overview

Demineralization is a water treatment technique that removes impurities such as calcium, silica, iron, and magnesium from water. The demineralization plant consists of two beds of chemically treated resin beads that operate in series. Water purification is a process that alters used or polluted water to its natural state, making it suitable for several applications in various fields.

Lead-acid batteries are extensively used in the automotive industry across the globe since they have been designed to maximize current paths and lower internal resistance. The growing automotive market and the rising demand for lead-acid batteries, is increasing the need for recycling these batteries. This, in turn, will increase the need for pure water that is achieved through demineralization process.
