## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dendritic Polyester Polyols competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Dendritic polyester polyols reached approximately 220 kilotons, with an average global market price of around USD 1300 per ton. Dendritic polyester polyols are a class of highly branched macromolecules with a tree-like (dendritic) architecture built from repeating units of polyester chains and terminal hydroxyl (-OH) groups. These polyols exhibit a high functionality (i.e., many reactive end groups), low viscosity, and compact molecular structure compared to linear or lightly branched polyesters. Their unique architecture imparts superior properties such as enhanced solubility, lower surface tension, and faster curing behavior, making them especially useful in high-performance polyurethane systems. They are commonly synthesized through step-growth polymerization using multifunctional alcohols and carboxylic acids or their derivatives, and are utilized in coatings, adhesives, sealants, elastomers, and biomedical applications due to their tunable reactivity and mechanical properties.

The global Dendritic Polyester Polyols market size was estimated at USD 279.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
