## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Densified Polyimide Foam competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Densified Polyimide Foam production reached approximately 367.86 tons with an average global market price of around k US\$560 per ton. Densified polyimide foam is a specialized variant of polyimide foam where the cell structure has been compressed and integrated to create a more compact and robust material. This densification process results in a foam with enhanced mechanical strength and rigidity, while still retaining the inherent thermal stability and chemical resistance of polyimide. The essence of densification lies in the transformation of the foam's cellular network, which allows it to better withstand mechanical stress and provide a sturdier platform for structural applications. By reducing the porosity and increasing the density, this foam offers improved dimensional stability and a higher resistance to compression, making it a valuable asset for scenarios where a combination of lightweight and durability is essential.

The global Densified Polyimide Foam market size was estimated at USD 206.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
