Abstracts

Dent Disease treatment encompasses a range of therapeutic strategies aimed at managing a rare X-linked recessive renal tubular disorder characterized by low-molecular-weight proteinuria, hypercalciuria, nephrocalcinosis, and progressive kidney failure, with current approaches focusing on symptom alleviation through thiazide diuretics to reduce calcium excretion, angiotensin-converting enzyme inhibitors to mitigate proteinuria, and electrolyte supplementation, while emerging treatments target underlying genetic mutations using novel molecular techniques. The market remains highly specialized due to the disease's rarity, with an estimated prevalence of 1-10 cases per million, driving limited but focused investment in orphan drug development and personalized medicine, though current standard care relies predominantly on repurposed existing medications rather than disease-specific pharmaceuticals.

The global Dent Disease Treatment market size was estimated at USD 120.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
