Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dental Abutments competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Implant restoration basically consists of three parts: the implant itself, the abutment, and the crown. The abutment connects the implant and the crown, transferring the force of the crown (for example, through chewing movements) to the implant and then to the jawbone. This makes the abutment crucial in terms of force transmission, position fixation, tissue shaping, and aesthetics. As a component that connects the implant and the crown, the abutment plays an important role in the subsequent performance of the implant. Depending on the processing method, it can be divided into a finished abutment and a personalized abutment. Compared with the finished abutment with highly standardized parameters, the personalized abutment can be customized according to the specific situation in the patient's mouth. It is generally made using computer-aided design and manufacturing (CAD/CAM) according to the three-dimensional position of the implant and the three-dimensional space of the missing tooth gap. While helping patients repair missing or damaged edentulous arches and restore chewing function, it better guarantees the patient's comfort and social aesthetic needs.

The global Dental Abutments market size was estimated at USD 1142.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
