Abstracts

A dental airturbine handpiece is a high-speed, pneumatically powered rotary instrument used in dentistry for cutting, drilling, and removing tooth structure during procedures such as cavity preparation, crown and bridge work, and endodontic access. It operates using compressed air to drive a miniature turbine, enabling rotational speeds typically ranging from 300,000 to 400,000 RPM, which allows for precise and efficient tooth reduction with minimal patient discomfort. Modern airturbine handpieces often incorporate features such as fiber-optic illumination, autoclavability for sterilization, ergonomic designs to reduce operator fatigue, and compatibility with a variety of burs and attachments. They are a fundamental tool in general and restorative dentistry, valued for their speed, power, and ability to perform delicate work with high control.

The global Dental Airturbine Handpiece market size was estimated at USD 540.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
