Report Overview

Dental allograft bone material refers to the use of bone tissue from the same species but different individuals as a graft material for the repair and regeneration of oral and maxillofacial bone defects. Allograft bone materials are widely used in the field of dentistry, and can be used for dental implant surgery, bone defect repair after alveolar process resection, jaw augmentation surgery, etc. Compared with traditional autologous bone grafting, allograft bone material has the advantages of simple operation, less operation time and pain, and no need for secondary operation to take bone. However, allograft bone materials also have certain risks, such as graft rejection and the spread of infectious diseases, which need to be applied under strict clinical monitoring.

The global Dental Allograft Bone Material market size was estimated at USD 821.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
