Abstracts

Anti-caries paint is a new type of oral medical polymer material developed in the 1960s. It is applied to the pits and fissures of the tooth surface, and after curing, it forms a barrier, which can effectively seal the pits and fissures, and isolate the carious factors in the oral environment from damaging the teeth, thereby preventing the occurrence of caries. Its advent has opened up a new anti-caries approach for oral preventive medicine. According to a report released by Evaluate Medtech, the global dental device market will grow from US\$12.4 billion in 2015 to US\$18.3 billion in 2022, with a compound annual growth rate of about 5.7%. The social needs brought about by the aging population, the high incidence of oral diseases and the room for further improvement of services have laid a solid foundation for the development of oral medical devices. In the future, with the application of new technologies such as VR/AR technology and 3D printing, it will have a major impact on the entire dental industry.

The global Dental Anti-caries Coatings market size was estimated at USD 539.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
