## Abstracts

Carbide burs are made of tungsten carbide, a metal that is extremely hard (about three times stiffer than steel) and can withstand high temperatures. Because of their hardness, carbide burs can maintain a sharp cutting edge and be used many times without becoming dull. Carbide burs are used most commonly for excavating and preparing cavities, finishing cavity walls, finishing restoration surfaces, drilling old fillings, finishing crown preparations, contouring bone, removing impacted teeth, and separating crowns and bridges. Due to the large number of outpatients and high mobility in dental clinics, the usage rate and turnover rate of burs are high. In the future, the demand for cemented carbide dental needles will greatly increase. Oral disease, as one of the most common health problems, has always received high attention. With the continuous improvement of people's living standards and the gradual improvement of the requirements for the quality of life, the society's demand for oral health is increasing.
