Report Overview

Dental caries is one of the most common dental diseases. It is a condition of tooth decay and cavity formation where this condition is caused by specific types of bacteria. These bacteria create acid that destroys tooth enamel and dentin, the layer under it, forming a thick layer known as a plaque found in pits, cracks, grooves, and between teeth. As a result, a cavity is produced by breaking down the enamel and dentin layers. In addition, several techniques used in the diagnosis and detection of dental caries include X-ray, stain, liquid dye, and high technology machines such as lasers. The dental caries detector devices are used in examining the enamel structure and to record any changes.
