## Abstracts

Dental ceramic bearings are precision components made of ceramic materials and specifically designed for use in dental equipment. They are mainly used to support and enable the smooth rotation or movement of various parts in dental handpieces and other dental instruments. These bearings are typically made from high-performance ceramic materials such as zirconia or alumina, which offer excellent hardness, wear resistance, corrosion resistance, and biocompatibility. The high hardness of ceramic materials ensures that the bearings can withstand the high rotational speeds and forces generated during dental procedures without significant wear or deformation. Their corrosion resistance makes them suitable for use in the wet and corrosive environment of the oral cavity, and their biocompatibility ensures that they do not cause adverse reactions or harm to the patient's body.

The global Dental Ceramic Bearings market size was estimated at USD 60.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
