Abstracts

A dental clinical micromotor is a precision, high-speed rotary instrument used in dentistry for a variety of procedures, including cavity preparation, crown and bridge work, implantology, and endodontics. It operates at controlled speeds?typically ranging from 1,000 to 40,000 RPM?and is designed to provide torque and stability for cutting, grinding, polishing, and finishing tasks on both natural teeth and restorative materials. Key features often include programmable speed settings, autoclavability for infection control, ergonomic handpiece design to reduce operator fatigue, and compatibility with a wide range of burs and attachments. Modern micromotors may also integrate with digital systems for enhanced accuracy, offer LED lighting for improved visibility, and support reversible rotation for specific applications.
