## Abstracts

A dental desensitizing is a dental product designed to reduce tooth sensitivity by forming a protective barrier over exposed dentin or sealing open dentinal tubules. It works by blocking external stimuli, such as cold, heat, or acidic foods, from reaching the nerves inside the tooth. Teeth desensitizers commonly contain ingredients like fluoride, potassium nitrate, or calcium phosphate, which help remineralize enamel and strengthen tooth surfaces. These products are used in both professional dental treatments and over-the-counter formulations to provide long-lasting relief from hypersensitivity.

The global Dental Desensitizing market size was estimated at USD 264.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
