Report Overview

Dental etchants are acidic solutions used in dentistry to prepare the surface of teeth for bonding procedures. They are commonly applied to the enamel to create a rough surface that enhances the adhesion of dental materials such as composites and sealants. Dental etchants play a crucial role in ensuring the longevity and effectiveness of dental restorations by promoting strong bonding between the tooth structure and the dental material. With the increasing demand for aesthetic dental procedures and advancements in dental technology, the market for dental etchants is experiencing steady growth.
