Abstracts

Dental filling materials are biocompatible materials used to repair defects in tooth hard tissue caused by cavities, trauma, or wear. They mainly include composite resins, glass ionomer cement (GIC), and ceramic inlays, requiring good adhesion, wear resistance, aesthetics, and long-term sealing performance. The upstream of the industry chain includes suppliers of organic monomers, inorganic fillers (silica, zircon), photoinitiators, fluoride additives, and high-precision mixing/filling equipment. The midstream consists of dental material R&D and manufacturing companies, which must obtain Class III medical device certification from the National Medical Products Administration and meet ISO 13485 quality system standards. The downstream mainly targets dental clinics, chain groups, and public hospital dental departments. Due to mature technology but high brand barriers, the industry's overall gross profit margin is between 50% and 75%. The dental filling material market is steadily growing driven by rising dental caries prevalence, aging populations, and increased awareness of oral health worldwide. Composite resin materials continue to replace traditional amalgam due to superior aesthetics and improved bonding performance. Technological advances in nano-fillers, low-shrinkage resins, and bioactive materials enhance durability and reduce secondary caries risk. Demand is further supported by the expansion of private dental clinics and cosmetic dentistry. Digital dentistry integration also promotes standardized and efficient restorative procedures. Overall, the market is shifting toward high-performance, aesthetic, and environmentally friendly filling solutions.

The global Dental Filling Material market size was estimated at USD 5680.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
