### Report Overview:

Dental implants are artificial tooth roots made of materials such as titanium or zirconium that could be inserted into the jaw. They not only allow the replacement of the missing tooth for cosmetic and practical reasons, but also preserve the jaw structure by preventing bone restoration or atrophy. Compared to conventional fixed bridges or dentures, they require no grinding down of healthy neighboring teeth, do not cause discomfort when eating or speaking, and are long-lasting with a natural appearance. Another variation is when the crown and abutment are one piece and the lag-screw traverses both to secure the one-piece structure to the internal thread on the implant. Regardless of the type of abutment, after the abutment is attached to the implant, an impression is made and the designed restoration is constructed at the dental laboratory.

The Global Dental Implant Abutment Systems Market Size was estimated at USD 3988.79 million in 2023 and is projected to reach USD 4790.64 million by 2029, exhibiting a CAGR of 3.10% during the forecast period.
