Abstracts

In oral microsurgery, magnification and illumination are utilized to enhance the visualization of anatomical details and fine structures. The dental microscope is a crucial instrument in dental treatment and surgery, enabling optimal evaluation, protection, and maintenance of tooth structures and oral tissues, as well as facilitating minimally invasive procedures. The application of dental microscopes in oral surgery is extensive, as they improve the visualization of intricate anatomical and tissue structures. By using higher magnification to see more details, dental practitioners can apply their medical techniques with greater precision and optimize their workflow. Some of the most common applications of microsurgical techniques in oral surgery (also referred to as microdentistry) include endodontics and endodontic surgery, periodontics and periodontal surgery, implantology, prosthodontics and cosmetic dentistry, operative dentistry, oral surgery, and general dental techniques. The surgical microscope, as a fundamental device in modern healthcare, integrates multiple technologies such as optics, mechanics, electronics, software, and digitalization, playing a pivotal role in the construction of modern medical systems. Among these, the dental surgical microscope is specifically designed for clinical dental treatments, and its application in the field of dentistry marks a significant advancement in treatment technology. Although the use of dental surgical microscopes is relatively common in developed countries, their market penetration in China remains relatively low, with a limited industry scale. However, with the continuous growth of China's economy, accelerated urbanization, increased household income levels, and heightened awareness of oral health, oral health has gradually become a focal point for both the medical community and consumers. This trend has driven significant growth in the dental surgical microscope industry. In recent years, as numerous domestic and international companies have entered the dental surgical microscope market, competition has intensified. This has led to downward pressure on the prices and profit margins of mid-to-low-end products. If market

competition continues to intensify, the prices of dental surgical microscopes may further decline in the future. Compared to the mature demand in the global market, China's dental microscope industry is in a transitional phase from its infancy to initial development. Since 2019, the adoption of dental microscopes by domestic oral healthcare institutions has noticeably accelerated, and the popularization and promotion of microsurgical technology within the domestic oral healthcare industry are rapidly progressing. Currently, dental microscopes are widely used in the clinical, educational, and research fields of endodontics. In education, the application of dental microscopes is crucial for training oral healthcare professionals with practical experience and skills, particularly in the experimental teaching of endodontics, periodontics, prosthodontics, and oral implantology. In the global market, major manufacturers include Zeiss, Leica Microsystems, Suzhou Sumai Medical Technology Co., Ltd., Global Surgical Corporation, and Olympus. In 2024, these top five manufacturers collectively held over 83% of the market share. It is anticipated that industry competition will become more intense in the coming years, especially in the Chinese market, where competition is expected to be particularly significant.

The global Dental Operating Microscope market size was estimated at USD 486.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.20% during the forecast period.
