Abstracts

A dental optical scanner is a digital imaging device used in dentistry to capture precise three-dimensional representations of oral structures, such as teeth, gums, and dental arches, through non-contact optical technologies like structured light or laser triangulation. These scanners eliminate the need for traditional physical impressions by generating high-resolution digital models that serve as the foundation for computer-aided design (CAD) and computer-aided manufacturing (CAM) processes, enabling the fabrication of a wide range of dental prosthetics, orthodontic appliances, and surgical guides with enhanced accuracy, efficiency, and patient comfort.
