Abstracts

A dental plaque detector is a device or substance used to identify and locate dental plaque. Plaque detectors often contain edible pigments or dyes. After being applied to the tooth and gum surfaces and rinsing with water, the pigments selectively stain the dental plaque, making it clearly visible as a red or purple patch. Some advanced detectors use optical technology. For example, they project light beams onto the tooth surface and capture the reflected light through optical sensors. Dental plaque, with different optical properties from healthy tooth surfaces, causes variations in the reflected light, which the device analyzes to identify the presence and distribution of plaque.

The global Dental Plaque Detector market size was estimated at USD 86.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
