Abstracts

Dental polishing discs are specialized rotary instruments used in restorative and preventive dentistry for finishing and polishing composite restorations, ceramics, and other dental materials to achieve a smooth, aesthetic, and plaque-resistant surface. They typically consist of a flexible backing material, such as polyester or metal, coated with progressively finer abrasives?such as aluminum oxide, diamond, or silicon carbide?arranged in a disc shape with a central hole for attachment to a handpiece. These discs are categorized by grit size (coarse, medium, fine, and superfine) and are designed for sequential use to gradually refine surface texture, remove scratches, and enhance gloss without generating excessive heat or damaging the underlying tooth structure.

The global Dental Polishing Discs market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
