Abstracts

Dental self-etching adhesives are single-bottle or multi-step dental bonding systems used to prepare tooth surfaces for restorative procedures such as composite fillings, crowns, or veneers by simultaneously etching and priming enamel and dentin without requiring a separate acid-etching step. These adhesives simplify clinical workflows, reduce technique sensitivity, and minimize postoperative sensitivity by incorporating acidic monomers that demineralize and infiltrate tooth structure in a single application, offering advantages in moisture control and bonding efficiency over traditional etch-and-rinse systems. The market is driven by the rising demand for minimally invasive dentistry, technological advancements in adhesive formulations for improved bond strength and durability, and the growing global prevalence of dental caries and aesthetic dental procedures. Key players focus on product innovation?such as universal adhesives compatible with various substrates?while competition centers on clinical performance evidence, ease of use, and compliance with evolving regulatory standards for biocompatibility and efficacy.

The global Dental Self Etching Adhesive market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
