Report Overview

Dental adhesives can be roughly divided into four categories: general-purpose, total-etch, self-etch, and selective-etch. These terms refer to the technology used with dental adhesives, also known as adhesives. Universal dental adhesive is formulated to work with all three etching techniques. Dental adhesives can be self-curing, light-curing, or dual-curing, and cure times vary by product but are typically under 30 seconds. Solvents vary depending on the dental adhesive formulation, but are typically water, ethanol, or acetone. Self-etching refers to mixing acidic functional ingredients and coupling agents together, and tooth surface demineralization and coupling occur simultaneously, omitting an independent acid etching step.
