Abstracts

Dental separating agent is a specialized material used in dentistry to create a thin, precise gap between a tooth and a restoration (such as a crown, bridge, or inlay) or between adjacent teeth during certain procedures, ensuring proper fit, preventing adhesion, and facilitating easy removal of excess cement or temporary materials. Typically applied as a paste, liquid, or film, these agents act as physical barriers or release agents and are formulated to be biocompatible, easy to apply, and simple to clean after use. They play a critical role in improving the accuracy, longevity, and overall success of restorative dental work by minimizing contact and friction during placement.

The global Dental Separating Agent market size was estimated at USD 42.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
