Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Dentition Development Model competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Dentition Development Model production reached approximately 1.22 M units, with an average global market price of around US\$ 300 per unit. A Dentition Development Model refers to a specialized anatomical or educational model designed to demonstrate the stages of human tooth and jaw development from infancy through adulthood. These models accurately represent the formation, eruption, alignment, and replacement of deciduous (primary) and permanent (secondary) teeth, as well as the growth of the alveolar bone and jaw structures over time. Gross Profit Margin Analysis Dental development models, as indispensable teaching tools in oral education and clinical training, generally have high overall gross profit margins. Because these products are high-precision educational and medical simulation devices, strict requirements are placed on the model's anatomical structure, material simulation accuracy, and processing precision. Manufacturers often employ technologies such as injection molding, CNC precision carving, silicone molding, and 3D printing, resulting in high added value per unit. According to industry estimates, the average gross profit margin for dental development models globally generally ranges from 45% to 60%, with high-end brands even reaching over 70%. Mid-to-low-end manufacturers primarily focus on mass OEM and teaching equipment supply, resulting in relatively lower gross profit margins. However, relying on large-scale production and growing demand in the education market, their overall profitability remains stable. With the promotion of digital oral education and virtual simulation systems, the added functions of models (such as transparent jawbones, detachable teeth, and tooth germ display) are constantly being enriched, further enhancing the value per unit and brand profit margin. Driving

FactorsThe growth of the global dental development model market is driven by multiple factors. First, the expansion of oral medicine education systems and the standardization of teaching are the core drivers of growth, with dental schools, medical universities, and vocational training institutions worldwide continuously increasing their demand for visual and operable teaching models. Second, the development of pediatric dentistry and orthodontics has spurred the continued procurement of research models for different stages of tooth development, used to demonstrate the replacement of primary teeth, the eruption of permanent teeth, and the evolution of occlusal relationships. Third, advancements in 3D printing and digital simulation technologies have significantly improved the customization, transparency, and anatomical accuracy of models, reducing production cycles and expanding application scenarios. Simultaneously, policy-driven health education promotion and increased awareness of oral care have also stimulated the growth of the dental teaching aids market.

The global Dentition Development Model market size was estimated at USD 365.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
