Report Overview

Dentures are prosthetic devices used for replacing missing teeth. Denture stomatitis may be developed due to poor denture hygiene and plaque formation, furthermore dentures are also source of pathogens which can lead to various diseases. Denture disinfectants are used for cleansing (to remove food particles and plaque) and antimicrobial activity. Dentures are more prone to colonization of microorganisms which may develop infection or disease due plaque formation. To eliminate chances of developing infection or disease, denture disinfectants are used as they are more effective than other cleansing methods e.g. brushing. Removable dentures are required to clean on regular basis to avoid permanent staining and plaque formation. Denture disinfectants are used for cleaning of all types of removable dentures i.e. Acrylic dentures, Metal chrome dentures and flexible dentures. Poor oral health can negatively impact mental, social and general health. Due to increased resistance of microorganisms denture disinfectants are important part of denture cleansing. Dentures are immersed into the denture disinfectants solution for overnight for complete anti-microbial action.
