Abstracts

A deodorant finishing agent refers to a chemical treatment applied during the final stages of textile manufacturing or laundering, designed to impart long-lasting odor-neutralizing properties to fabrics. These agents typically contain antimicrobial compounds, such as silver ions, quaternary ammonium salts, or natural extracts like tea tree oil, which inhibit the growth of odor-causing bacteria on textile surfaces. Unlike temporary fragrances or masking agents, deodorant finishing agents work by targeting the microbial source of odors, ensuring fabrics remain fresh through multiple washes and extended wear. They are commonly integrated into sportswear, athleisure, intimate apparel, bedding, and medical textiles, where moisture management and hygiene are critical. The formulation may involve microencapsulation, covalent bonding, or nanotechnology to enhance durability, wash resistance, and compatibility with various fabric types, including synthetics and natural fibers.

The global Deodorant Finishing Agent market size was estimated at USD 2850.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
