Report Overview

Deodorant is a substance that is applied to the body parts to prevent body odor that is majorly caused by the bacterial breakdown of perspiration in major body parts such as armpits, feet and other areas of the body. Antiperspirants are regarded as sub category of deodorant. Deodorants and antiperspirants contain ingredients that can control sweat and body odour safely and effectively coming from body parts. Antiperspirants not only affect the odor of the body, also reduces sweating by affecting sweat glands.

Antiperspirants are majorly applied to the underarms of the body, where as deodorants can also be applied to the feet and other body parts as body spray. Deodorants and antiperspirants are mostly confused as similar product, but both differ in function and application. Antiperspirants control sweating and body odour in two different steps. Firstly it prevents sweat reaching the skin surface, and secondly it eliminates the bacteria that causes body odour as it contain antimicrobial agent as its major ingredient. On the other hand, deodorants only contain antimicrobial agents that prevent body odour coming from different part of the body, but are unable to control the flow of sweat. There is one similarity between both deodorants and antiperspirants that both contain fragrances which helps in keeping body odour away from the body.
