## Abstracts

Deparaffinization solutions are chemical reagents used in histology and pathology laboratories to remove paraffin wax from tissue sections embedded in paraffin blocks, a critical preparatory step prior to staining and microscopic examination. These solutions typically consist of organic solvents such as xylene, toluene, or safer, less toxic alternatives like limonene-based or isoparaffinic hydrocarbon formulations, designed to dissolve and wash away the embedding medium without damaging the underlying tissue architecture. The process ensures that cellular details are exposed and accessible for diagnostic or research applications, making these solutions indispensable in workflows involving formalin-fixed, paraffin-embedded (FFPE) tissue samples. The market for these products is driven by the demand in healthcare diagnostics, academic research, pharmaceutical development, and forensic science, with an increasing emphasis on user safety, environmental sustainability, and compatibility with automated staining systems.

The global Deparaffinization Solution market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
