Abstracts

The depolarization splitting cube is made of two right angle prisms of the same size glued together. One of the right angle prisms is coated with depolarization splitting film. The splitting film can be metal or all dielectric. The components of p-light and s-light in the reflected or transmitted light obtained by depolarization splitting cube are nearly the same, which is especially suitable for polarization sensitive receivers in some applications. The driving force behind depolarization splitting prisms comes from the rapid development of precision optical systems, laser technology, and medical imaging. With the widespread application of lasers and high-resolution optical instruments in scientific research, semiconductor manufacturing, and industrial automation, the requirements for beam splitting accuracy and polarization elimination continue to increase, prompting the market demand for high-performance depolarization splitting prisms to rise. In the upstream supply chain, the continuous advancement of high-purity optical materials and the continuous optimization of coating processes have enhanced the anti-reflection and durability of prisms, promoting the improvement of product performance. With the diversification of application scenarios, especially in the fields of smart manufacturing and precision medicine, the demand for high-precision, customized depolarizing prisms has gradually increased. In terms of regional markets, the rapid growth of Asia-Pacific's investment in industrial and medical equipment indicates that the region will become one of the major consumer markets.

The global Depolarization Splitting Prism market size was estimated at USD 823.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
