Abstracts

Deproteinized medical surgical gloves are medical gloves that undergo a special process to remove protein components from natural rubber, primarily used in surgical and medical procedures to reduce the risk of allergic reactions. Traditional natural rubber gloves may contain allergenic proteins that can trigger allergic reactions in some patients and healthcare workers. The deproteinization process effectively removes these components, reducing the likelihood of allergies. These gloves offer high strength, excellent tactile sensitivity, and comfort, while providing essential protective features, making them widely used in surgeries, diagnostics, and other medical procedures.
