Abstracts

Dermal necrosis treatment refers to the medical interventions and therapeutic approaches aimed at addressing localized tissue death in the skin, which can result from various etiologies such as vascular compromise, infection, trauma, pressure injuries, radiation exposure, or complications from conditions like diabetes or autoimmune disorders. These treatments span a spectrum of modalities, including conservative wound care (debridement, specialized dressings, and topical agents), pharmacological management (antibiotics, vasodilators, or growth factors), advanced therapies (hyperbaric oxygen, negative pressure wound therapy, or skin substitutes), and surgical options (grafting, flap reconstruction, or amputation in severe cases), with the overarching goals of removing non-viable tissue, promoting angiogenesis, preventing infection, and facilitating regeneration or repair of the affected area.
