### Report Overview

Skin is the largest organ of the human body. It is composed of three layers: epidermis-the outermost layer; dermis-contains sweat glands, hair follicles and connective tissue and hypodermis-made up of fat and connective tissue. The main functions of the skin includes protection, sensation and regulation. The skin acts as a barrier and provides protection against harmful chemicals, radiation, microorganism and changing environmental conditions. It also helps regulate body temperature and maintain fluid balance. Skin is an extensive network of nerve cells and contains various receptors to detect changes in the environment such as touch, pain, heat and cold. Damage to skin due to burn or trauma can disrupt all the vital functions performed by the skin.
