Report Overview

Dermatoscopy (also known as dermoscopy or epiluminescence microscopy) is the examination of skin lesions with a dermatoscope. This traditionally consists of a magnifier (typically x10), a non-polarised light source, a transparent plate and a liquid medium between the instrument and the skin, and allows inspection of skin lesions unobstructed by skin surface reflections. Modern dermatoscopes dispense with the use of liquid medium and instead use polarised light to cancel out skin surface reflections. Dermatoscope can be well observed in the epidermis, the epidermis and dermis junction structure pigments and superficial vascular plexus vessel size and morphology within the superficial dermis, in order to make the appropriate diagnosis of pigmented skin.
