Abstracts

Design and Verification IP Service refers to the process of creating and testing intellectual property (IP) blocks that are used in the design of integrated circuits. This service involves developing reusable design components, such as processors, memory controllers, and interfaces, that can be integrated into larger chip designs. Verification IP is used to ensure that these components function correctly and meet the design specifications. By utilizing Design and Verification IP Service, semiconductor companies can accelerate the development of their products, reduce time-to-market, and improve overall design quality. The Design and Verification IP Service industry is undergoing transformative trends driven by technological advancements and market demands. AI and machine learning are revolutionizing IP design and verification. AI also optimizes test case generation, bug detection, and coverage analysis, reducing verification time by 30-50%. This trend is critical for managing the complexity of modern SoCs with billions of transistors. As protocols like PCIe 7.0 and DDR5 become increasingly complex, the market for commercial VIP has surged, now accounting for 50-60% of the overall verification IP landscape. This shift is driven by the need for pre-verified, standardized solutions that reduce development time and ensure compliance with evolving industry standards. Companies are increasingly prioritizing commercial VIP to focus on core value-added tasks rather than internal tool development.

The global Design and Verification IP Service market size was estimated at USD 2785.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
