Abstracts

Desktop cloud management software is a platform for centralized delivery, control and maintenance of the "cloud computing + local display" model. It places the operating system, applications and data on the server or hyper-converged node, and projects the desktop screen to thin clients, PCs, tablets and even mobile phones through remote display protocols. Administrators can complete image template creation, pooled publishing, permission policies, patch distribution, peripheral management, performance monitoring and elastic expansion in a single console, achieving batch delivery of hundreds or thousands of consistently available desktops in minutes. It also supports offline snapshots, backups and rollbacks to ensure that terminal failures can be recovered in seconds. With the help of GPU virtualization, application layering and multi-tenant billing, the software can support both ordinary office work and complex scenarios such as graphic design, remote development, and call centers. Through unified scheduling of network, computing and storage resources, it reduces the traditional decentralized terminal operation and maintenance workload by more than 90%, becoming the core infrastructure for reducing costs and increasing efficiency for government and enterprise cloud computing, remote office, education and training, and call centers.

The global Desktop Cloud Management Software market size was estimated at USD 274.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
