## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Desktop PDU competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A desktop PDU is a small power distribution unit suitable for placement on a table or at the edge of a cabinet. It is used to provide controlled power output and some monitoring/protection functions to multiple devices (such as workstations, network equipment, instruments, etc.); global desktop PDU shipments are estimated to be approximately 7.3 million units in 2024, with an average unit price of approximately US\$80 per unit. A typical production line may have an annual production capacity of around 30,000 to 100,000 units. Its upstream includes metal casing and injection molding factories, plug and socket and circuit breaker factories, surge suppressor and filter factories, PCB substrate and passive component suppliers, cable and connector factories, and power and control module suppliers, while its downstream includes office equipment OEMs, IT terminal equipment, monitoring system manufacturers, and small and medium-sized computer rooms and network cabinet system integrators; for example, if a computer room has 1,000 network and computing devices, then it will roughly "consume" 1,000 desktop PDUs; in terms of gross profit margin, desktop PDU manufacturers can usually obtain 15% to 25%. The gross profit margin may be reduced to 8% to 15% in a standardized and highly competitive environment.

The global Desktop PDU market size was estimated at USD 584.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
